HIFU

High Intensity Focused Ultrasound

HIFU, What is it? And What Does it do?

What is HIFU Treatment?

HIFU stands for 'High Intensity Focused Ultrasound', this treatment can target various depths of the body's tissue for skin tightening, skin lifting and body contouring.

Entirely non-invasive, HIFU works by targeting deep layers in the skin – it boosts new collagen production and collagen regeneration right at the source. It is sometime called the 'Lunchtime Face Lift' as the treatment is quick, very tolerable and has no downtime.

What is HIFU treatment for face?

HIFU treatment for the face works as a non-invasive facelift. It tightens the skin, irons out wrinkles, shrinks pores, targets the 'V' line formation and Jowell lines. HIFU improves overall skin tone, pores, brightness and elasticity.

What is HIFU treatment for body / weight loss / inch loss?

Ultraformer's 9mm and 13mm cartridges are used for the body, here HIFU energy is used to target the fat layer and destroy fat cells. HIFU is ideal for body contouring post pregnancy tummy, abdomen fat, bingo wings, thighs and under the buttocks; for a non-surgical bum lifting effect. It can even tighten the skin on the knees and arms, helping to improve the 'crepey' look. HIFU is a very effective treatment for both inch loss and fat loss – at the same time tightening the skin!

Services

HIFU BROW LIFT	30min	\$US199
